

ABSTRACT

An ocular lens material comprising a siloxane-containing polymer obtained by polymerizing a monomer mixture containing (A) a
5 siloxane macromonomer having at least two active unsaturated groups
and a number average molecular weight of 2,000 to 100,000; and (B) a
vinyl ester of lower fatty acid as essential components. An ocular lens
material comprising a polymer obtained by saponification of the
siloxane-containing polymer. Processes for producing the ocular lens
10 materials. The ocular lens materials are excellent not only in lipid-stain
resistance, wettability and oxygen permeability, but also in flexibility,
particularly, shape recovery at the same time.
